Ailegis, Coding Assignment

Thank you for your interest in joining us!!

Goal:

The purpose of this assignment is to assess your scraping capabilities.

Due to a lack of creativity, the goal will be to scrape a section of the ETHZ website.

Task:

The website is: https://ethz.ch/en/doctorate.html

Scan all possible subpages of the doctorate path.

Create a single .json file to store all of the results.

The .json format should include an array of all the subsections of the website.

Each subsection should have:

- Title (a string)
- URL (a string) (if possible the url should map to the specific subsection with #identifiers)
- Content (a string)
- An array with all the attached files (file name and URL, both strings)

Note that some sections of the web-page are not relevant,

such sections should not be in the content string.

Bonus:

Scrape for all available languages (have a .json file per language).

Scrape the content of the files attached.

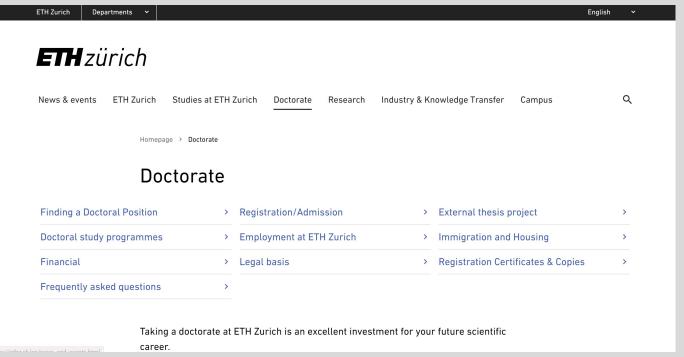

Any other feature you think could be useful, or show off your skills.

Constraints:

Use Python or TypeScript.

Delivery:

Create a GitHub repository with all the code used under src/ and the scraped data under results/. Write a maximum of 2 sentences on what you would have done if you had more time.
